

# CODE SPLITTING

Allows you to split your code into various bundles which you can then load on demand — like when a user navigates to a matching route, or on an event from the user.

```
import(); or require.ensure();
```

# CODE SPLITTING

```
class MyButton extends Component {  
  
  componentDidMount(){  
    import('moment').then(function(moment) {  
      console.log(moment().format());  
    }).catch(function(err) {  
      console.log('Failed to load moment', err);  
    });  
  }  
  
  onClick(){  
    alert(moment().format("dddd, MMMM Do YYYY"));  
  }  
  
  // ...  
}
```
